RE: Colorectal Cancer Awareness  

Release Date: March 2014  

Early Screening Essential to Prevention and Increasing Cure Rate  

Central Michigan District Health Department wants to make consumers aware that colorectal cancer, although a potentially life-threatening disease, is preventable with early detection. “Colorectal Cancer is the second leading cause of cancer deaths in the United States, with over 56,000 people expected to die from this disease each year,” explains Dr. Robert Graham, Medical Director for the Central Michigan District Health Department. “However, it is a preventable and very curable disease if caught early.”

Because there are often no symptoms when it is first developing, colorectal cancer can only be detected through regular early screening. “The benefits of early detection and treatment are dramatic,” Dr. Graham says. “The possibility of curing patients after symptoms develop is only 50%, but if colorectal cancer is found and treated at an early stage before symptoms develop, the opportunity to cure is 80% or better.”

If you are between the ages of 50 and 64, family history of colorectal cancer, colon polyps, inflammatory bowel disease, and Crohn’s disease are factors that create a higher risk for colorectal cancer. All men and women of average risk for colorectal cancer should have regular colorectal cancer screening after the age of 50. Your doctor may recommend earlier screening if you have one or more risk factors. Call your medical care provider and ask about his/her recommendations for screening.
Dr. Graham notes that in addition to getting screened regularly for colorectal cancer, people can lower their risk of getting the disease by:

- Avoiding foods that are high in fat
- Eating plenty of vegetables, fruits, and other high-fiber foods
- Exercising regularly and maintaining a normal body weight
- Not smoking
- Drinking alcohol only in moderation

For more information on colorectal cancer prevention and screening, visit www.cancer.org or www.cdc.gov/cancer.
